

INTRO TO DATA SCIENCE LECTURE 16: MAP-REDUCE

I. BIG DATA
II. HADOOP ECOSYSTEM
III. MAP-REDUCE PROGRAMMING MODEL

EXERCISE:

V. MAP-REDUCE USING PIG

INTRO TO DATA SCIENCE

I. BIG DATA

BIG DATA

As you have probably heard, big data is a hot topic these days.

Q: What does "big data" actually refer to?

BIG DATA

As you have probably heard, big data is a hot topic these days.

Q: What does "big data" actually refer to?

A: Scalability; in particular, storing & processing web-scale (multi-terabyte) datasets...

One approach would be to get a huge supercomputer.

But this has some obvious drawbacks:

- expensive
- difficult to maintain
- scalability is bounded

BIG DATA

Instead of one huge machine, what if we got a bunch of regular (commodity) machines?

BIG DATA

Instead of one huge machine, what if we got a bunch of regular (commodity) machines?

This has obvious benefits!

- cheaper
- easier to maintain
- scalability is unbounded (just add more nodes to the cluster)

Now we can give a complete answer to our earlier question.

Q: What does "big data" actually refer to?

Now we can give a complete answer to our earlier question.

Q: What does "big data" actually refer to?

A: Scalability; in particular, storing & processing web-scale (multi-terabyte) datasets using clusters of multiple computing nodes.

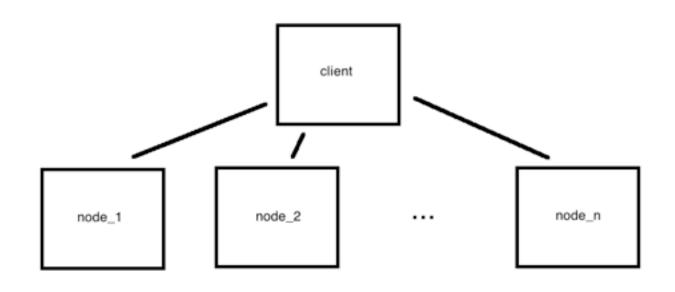

Now we can give a complete answer to our earlier question.

Q: What does "big data" actually refer to?

A: Scalability; in particular, storing & processing web-scale (multi-terabyte) datasets using clusters of multiple computing nodes.

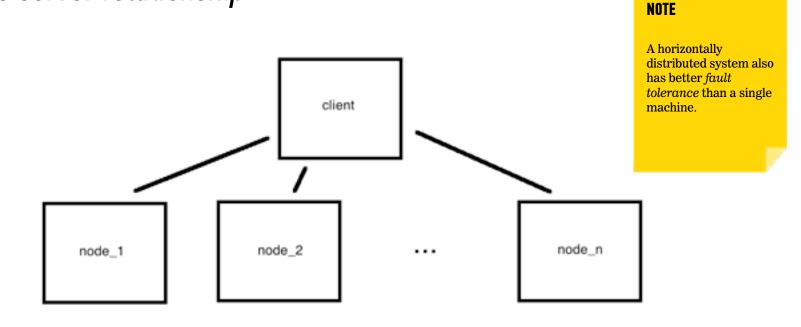

"Scale out vs scale up!"

We can visualize this horizontal cluster architecture as a single clientmultiple server relationship

BIG DATA

We can visualize this horizontal cluster architecture as a single clientmultiple server relationship

BIG DATA

How do we process data in a distributed architecture?

- move code to data

- map-reduce → less overhead (network traffic, disk I/0)

"Computing nodes are the same as storage nodes."

Divide and conquer is a fundamental algorithmic technique for solving a given task, whose steps include:

Divide and conquer is a fundamental algorithmic technique for solving a given task, whose steps include:

- 1) split task into subtasks
- 2) solve these subtasks independently
- 3) recombine the subtask results into a final result

Map-reduce leverages the divide and conquer approach by splitting a large dataset into several smaller datasets and performing a computation on each of these in parallel.

The defining characteristic of a problem that is suitable for the divide and conquer approach is that it can be broken down into independent subtasks.

The defining characteristic of a problem that is suitable for the divide and conquer approach is that it can be broken down into independent subtasks.

Tasks that can be parallelized in this way include:

- count, sum, average
- grep, sort, inverted index
- graph traversals, **some** ML algorithms

The defining characteristic of a problem that is suitable for the divide and conquer approach is that it can be broken down into independent subtasks.

Tasks that can be parallelized in this way include:

- count, sum, average
- grep, sort, inverted index
- graph traversals, **some** ML algorithms

NOTE

Parallelizing an ML algorithm can be a non-trivial exercise!

INTRO TO DATA SCIENCE

II. HADOOP ECOSYSTEM

Hadoop is a popular open-source Java-based implementation of the map-reduce framework (including file storage for input/output).

Google	Open-source	Function
GFS	HDFS	Distributed file system
MapReduce	MapReduce	Batch distributed data processing
Bigtable	HBase	Distributed DB/key-value store
Protobuf/Stubby	Thrift or Avro	Data serialization/RPC
Pregel	Giraph	Distributed graph processing
Tenzing	Hive	Scalable SQL on MapReduce
Dremel/F1	Cloudera Impala	Scalable interactive SQL (MPP)
FlumeJava	Crunch	Abstracted data pipelines on Hadoop

Hadoop is a popular open-source Java-based implementation of the map-reduce framework (including file storage for input/output).

You can download Hadoop and configure a set of machines to operate as a map-reduce cluster, or you can run it as a service via Amazon's Elastic Map-Reduce.

Frequently when people say "map-reduce" they're referring to Hadoop, but there are some exceptions:

Frequently when people say "map-reduce" they're referring to Hadoop, but there are some exceptions:

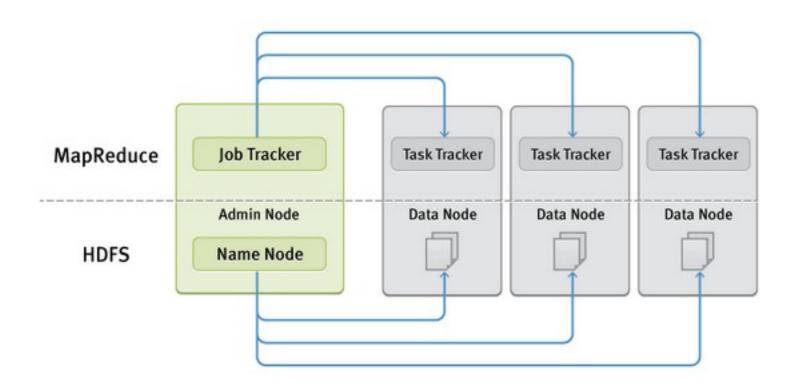

- many NoSQL databases support native map-reduce queries
- commercial distributions (Cloudera, MapR, etc)
- Google's internal implementation

Hadoop is a popular open-source Java-based implementation of the map-reduce framework (including file storage for input/output).

Hadoop is a popular open-source Java-based implementation of the map-reduce framework (including file storage for input/output).

More often, Hadoop refers to the ecosystem of tools around distributed computing with two main components:

- distributed filesystem (HDFS)
- map-reduce job scheduler

Google	Open-source	Function
GFS	HDFS	Distributed file system
MapReduce	MapReduce	Batch distributed data processing
Bigtable	HBase	Distributed DB/key-value store
Protobuf/Stubby	Thrift or Avro	Data serialization/RPC
Pregel	Giraph	Distributed graph processing
Tenzing	Hive	Scalable SQL on MapReduce
Dremel/F1	Cloudera Impala	Scalable interactive SQL (MPP)
FlumeJava	Crunch	Abstracted data pipelines on Hadoop

The Google File System (GFS) was developed alongside map-reduce to serve as the native file system for this type of processing.

Data is replicated in the (distributed) file system across several nodes.

Data is replicated in the (distributed) file system across several nodes.

This permits locality optimization (and fault tolerance) by allowing the mapper tasks to run on the same nodes where the data resides.

Data is replicated in the (distributed) file system across several nodes.

This permits locality optimization (and fault tolerance) by allowing the mapper tasks to run on the same nodes where the data resides.

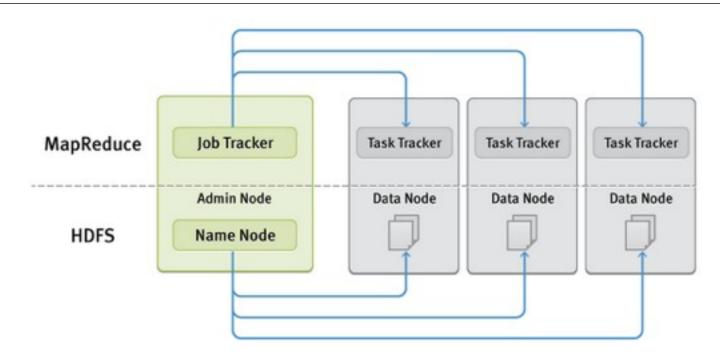

So we move code to data (instead of data to code), thus avoiding a lot of network traffic and disk I/O.

HDFS benefits include:

- Push compute tasks to data nodes to avoid data transfer

- Data replication: data is replicated so if a single machine fails another still contains the data

HADOOP

 $Source: \underline{http://www.ndm.net/datawarehouse/Greenplum/hadoop-components}$

HADOOP

Log storage and analysis

Used for charts calculation, royalty reporting, log analysis, A/B testing, dataset merging
Also used for large scale audio feature analysis over millions of tracks

Large-scale image conversions

The map-reduce framework handles a lot of messy details for you:

IMPLEMENTATION DETAILS

The map-reduce framework handles a lot of messy details for you:

- parallelization & distribution (eg, input splitting)
- partitioning (shuffle/sort/redirect)
- fault-tolerance (fact: tasks/nodes will fail!)
- I/O scheduling
- status and monitoring

IMPLEMENTATION DETAILS

The map-reduce framework handles a lot of messy details for you:

- parallelization & distribution (eg, input splitting)
- partitioning (shuffle/sort/redirect)
- fault-tolerance (fact: tasks/nodes will fail!)
- I/O scheduling
- status and monitoring

This (along with the functional semantics) allows you to focus on solving the problem instead of accounting & housekeeping details.

It's possible to overlay the map-reduce framework with an additional declarative syntax.

This makes operations like select & join easier to implement and less error prone.

Popular examples include Pig and Hive.

HADOOP

Google	Open-source	Function
GFS	HDFS	Distributed file system
MapReduce	MapReduce	Batch distributed data processing
Bigtable	HBase	Distributed DB/key-value store
Protobuf/Stubby	Thrift or Avro	Data serialization/RPC
Pregel	Giraph	Distributed graph processing
Tenzing	Hive	Scalable SQL on MapReduce
Dremel/F1	Cloudera Impala	Scalable interactive SQL (MPP)
FlumeJava	Crunch	Abstracted data pipelines on Hadoop

Apache Hive

- SQL language to query data on HDFS
- Queries are translated behind the scenes into map-reduce jobs
- Data is stored on HDFS, but a metadata database contains the table schemas

Cloudera Impala

- **ANOTHER** SQL language to query data on HDFS
- Similar interface to Hive

BUT:

- Impala contains its own scheduling engine, queries are not translated map-reduce jobs
 - Leads to faster queries, but no fault tolerance

Because I bet you can read the following script.

source: http://www.slideshare.net/kevinweil/hadoop-pig-and-twitter-nosql-east-2009

A Real Pig Script

```
top 5.pig
users = load 'users.csv' as (username: chararray, age: int); -
users_1825 = filter users by age >= 18 and age <= 25;-
pages = load 'pages.csv' as (username: chararray, url: chararray); -
joined = join users_1825 by username, pages by username;
grouped = group joined by url;
summed = foreach grouped generate group as url, COUNT(joined) AS views; -
sorted = order summed by views desc;
top 5 = limit sorted 5;-
store top_5 into 'top_5_sites.csv';
```

Now, just for fun... the same calculation in vanilla Hadoop MapReduce.

No, seriously.

```
The the scene product and religion the religion for religion to the religion of the religion o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Family - The Company of the Company 
                                                                                                                        blos beed magninegatistatus b. Seen van.

```

Parquet Data Storage

- Nested columnar data storage
- Based on Google Dremel paper
- Open-sourced by Cloudera and Twitter in July 2013

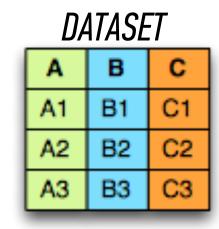

"Ideal for tables containing many columns, where most queries only refer to a small subset of the columns"

Parquet Data Storage

Parquet Data Storage

ROW-ORIENTED STRUCTURE

COLUMN-ORIENTED STRUCTURE

A1 A2 A3 B1 B2 B3 C1 C2 C3

Parquet Data Storage

Advantages

- Limit I/O depending on columns queried
- Filter rows before reading all columns
- Efficient compression

INTRO TO DATA SCIENCE

III. MAP-REDUCE PROGRAMMING

As we've discussed, the map-reduce approach involves splitting a problem into subtasks and processing these subtasks in parallel.

As we've discussed, the map-reduce approach involves splitting a problem into subtasks and processing these subtasks in parallel.

This takes place in two phases:

As we've discussed, the map-reduce approach involves splitting a problem into subtasks and processing these subtasks in parallel.

This takes place in two phases:

- 1) the mapper phase
- 2) the reducer phase

As we've discussed, the map-reduce approach involves splitting a problem into subtasks and processing these subtasks in parallel.

This takes place in (approximately) two phases:

- 1) the mapper phase
- 1.5) shuffle/sort
- 2) the reducer phase

Map-reduce uses a functional programming paradigm. The data processing primitives are mappers and reducers, as we've seen.

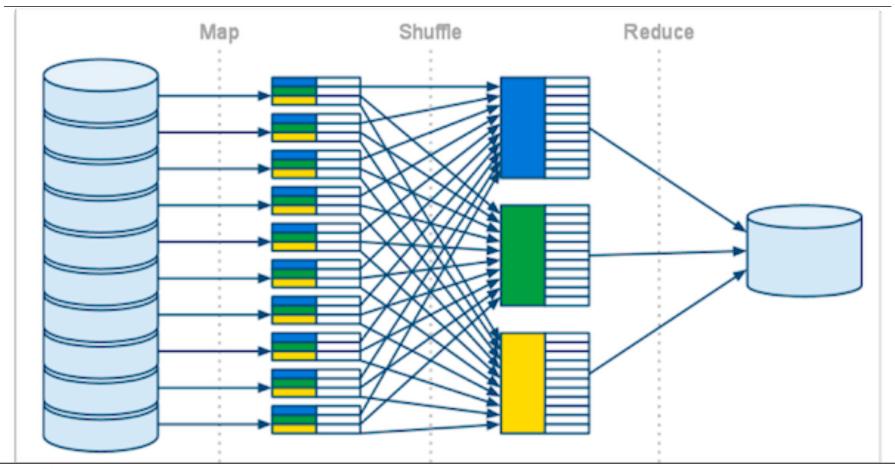

Map-reduce uses a functional programming paradigm. The data processing primitives are mappers and reducers, as we've seen.

mappers — filter & transform data reducers — aggregate results

Map-reduce uses a functional programming paradigm. The data processing primitives are mappers and reducers, as we've seen.

mappers — filter & transform data reducers — aggregate results

The functional paradigm is good at describing how to solve a problem, but not very good at describing data manipulations (eg, relational joins).

As our earlier diagram suggests, there are additional intermediate steps in a map-reduce workflow.

mappers — filter & transform data reducers — aggregate results

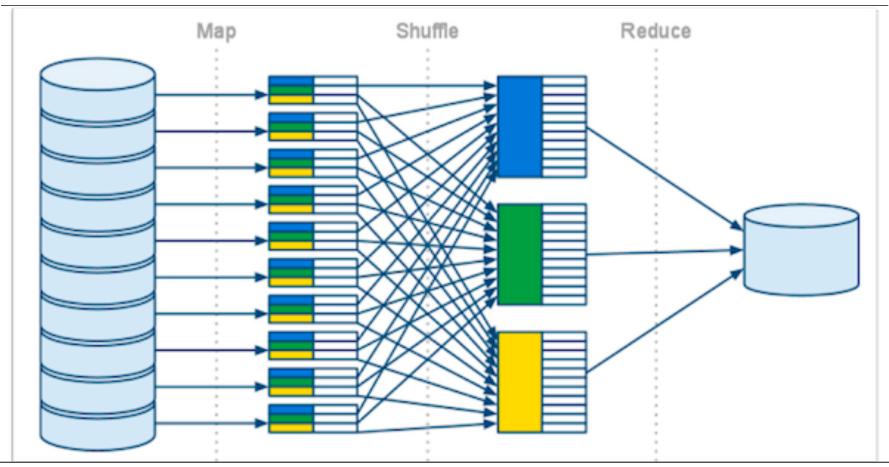

As our earlier diagram suggests, there are additional intermediate steps in a map-reduce workflow.

mappers — filter & transform data

combiners — perform reducer operations on the mapper node (optional step, to reduce network traffic and disk I/O).

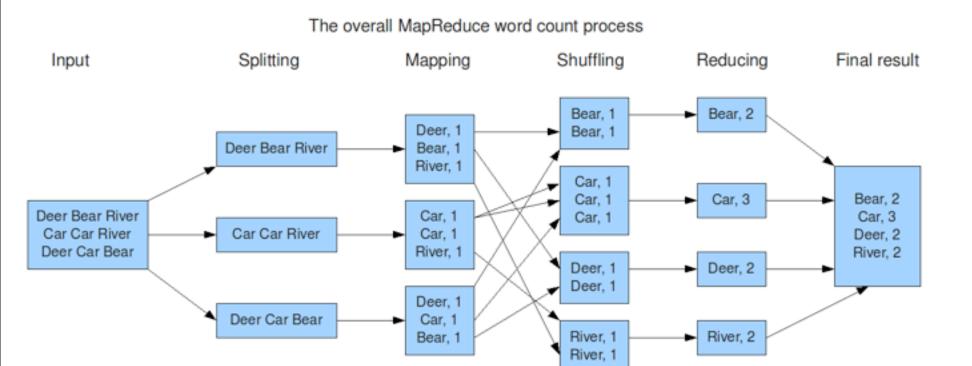

partitioners — shuffle/sort/redirect mapper output

reducers — aggregate results

INTRO TO DATA SCIENCE

III. WORD COUNT EXAMPLE

Map-reduce processes data in terms of key-value pairs:

input <k1, v1>

manner /k1 v1>

mapper $\langle k1, v1 \rangle \rightarrow \langle k2, v2 \rangle$

(partitioner) $\langle k2, v2 \rangle \rightarrow \langle k2, [all k2 values] \rangle$

reducer <k2, [all k2 values]> → <k3, v3>

MAP-REDUCE EXAMPLE

Using the following input, we can implement the "Hello World" of map-reduce: a word count.

MAP-REDUCE EXAMPLE: MAPPER INPUT

Using the following input, we can implement the "Hello World" of map-reduce: a word count.

```
where in where in the world where in the world is where in the world is carmen where in the world is carmen sandiego
```

MAP-REDUCE EXAMPLE: MAPPER

The first processing primitive is the mapper, which filters & transforms the input data, and emits transformed key-value pairs.

MAP-REDUCE EXAMPLE: MAPPER

The first processing primitive is the mapper, which filters & transforms the input data, and emits transformed key-value pairs.

```
mapper(k1, v1):
// k1 = line number
// v1 = line contents (eg, space-delimited string)

words = tokenize(v1) // split string into words
for word in words:
    emit (word, 1)
```

MAP-REDUCE EXAMPLE: MAPPER OUTPUT

The mapper emits key-value pairs for each word encountered in the input data.

MAP-REDUCE EXAMPLE: MAPPER OUTPUT

The mapper emits key-value pairs for each word encountered in the input data.

```
where 1 in 1 where 1 in 1 the 1
```

MAP-REDUCE EXAMPLE: PARTITIONER

The partitioner is internal to the map-reduce framework, so we don't have to write this ourselves. It shuffles & sorts the mapper output, and redirects all intermediate results for a given key to a single reducer.

MAP-REDUCE EXAMPLE: PARTITIONER OUTPUT

The partitioner is internal to the map-reduce framework, so we don't have to write this ourselves. It shuffles & sorts the mapper output, and redirects all intermediate results for a given key to a single reducer.

```
where
    [1, 1, 1, 1, 1, 1, 1]
in
    [1, 1, 1, 1, 1, 1]
the
    [1, 1, 1, 1, 1]
world
is
    [1, 1, 1, 1]
carmen
    [1, 1]
sandiego
[1]
```

MAP-REDUCE EXAMPLE: REDUCER

Finally, the reducer receives all values for a given key and aggregates (in this case, sums) the results.

MAP-REDUCE EXAMPLE: REDUCER

Finally, the reducer receives all values for a given key and aggregates (in this case, sums) the results.

```
reducer(k2, k2_vals):
// k2 = word
// k2_vals = word counts
emit k2, sum(k2_vals)
```

MAP-REDUCE EXAMPLE: REDUCER OUTPUT

Reducer output is aggregated...
